

New from Keyflow

Keyflow Nurture®

Predigested Stud Feed

Nurture® is a scientifically formulated hi-fibre feed designed to provide comprehensive nutrition for equine stud animals as well as all horses that require musculature and skeletal development and growth. Nurture® is molasses free but highly palatable whilst remaining very low in sugar and starch. The feed has been pre-digested by way of steam extrusion for maximum nutrient absorption. Nurture® contains the long chain omega 3 fatty acid DHA which has been shown to support semen motility, mare postpartum recovery as well as foal development and behaviours. The protein sources used in Nurture® (EQ Amino Pack) are of the highest quality with an amino acid profile carefully matched to that of the equine supporting even, optimal growth and development.

Nurture® is presented in a hi-fibre, steam extruded kibble which is easy to pick up (even when dropped out in the field), chew and digest. Being pre-digested, the product can be fed at lower feeding rates than traditional stud cubes, pellets and mixes, making it more economical to feed as well as ideally suited highly sympathetic to the equine digestive system. Nurture® is ideal for horses that have restricted or no access to high quality pasture or need an energy and nutrient dense ration added to their current diet.

Suitable for:

Barren mares | In-foal Mares | Lactating Mares | Foals | Weanlings | Yearlings | Yearling Prep | 2YOs | Stallions
| All horses that require musculature development and growth

Ingredients	Analysis		Feeding Guide	
Pressure cooked and fully steam extruded fibre & protein meals, (inclu. soya hulls, alfalfa, rapeseed, full fat soya), steam extruded cereal & omega 3 meals (inclu. wheat, rapeseed & linseed), cold pressed rapeseed oil (omega 3), heat stable vitamins & chelated minerals, vegetable source DHA (docosahexaenoic acid).	Est. DE	12 MJ/kg	Barren mares	400g per 100kg of b/w
	Starch	12%	Foals/Weanlings	
	Sugars.	3.2%	Yearlings	
	Protein	16.5%	Yearling Prep	500g per 100kg of b/w
	Oil	7.5%	2YOs	
	Fibre	20%	Working/covering Stallions	600g per 100kg of b/w
	Ash	9.4%	In-foal mares	
	Copper	52 mg/kg	Horses requiring extra musculature development	
	Vit A	12,000 IU/kg	Lactating mares	
	Vit D	1200 IU/kg		800g per 100kg of b/w
Vit E	363 IU/kg			

Introduce Nurture® into the diet gradually over a minimum of 7 days, dietary changes should be made gradually. Total roughage offered should be between 1-2% of bodyweight daily. Fresh clean water must be made available at all times. Feeding quantities above are a guide only, Nurture® should be fed as part of a balanced diet.

Ideal uses

Where any stud horse has limited access to high quality pasture such as through the autumn/winter months or when in a stabling regime.

Stallions:

The high oil content is ideal for stallions who are working and using energy in their stud work - Nurture® also supports an increase in semen motility through the DHA content.

Dry mares:

As a nutrient base and platform for optimal condition allowing a mare the best possible chance of conception. Nurture® provides the building blocks for growth of the foetus through all stages of pregnancy. Emphasis is on even and correct development of soft tissue and skeletal structure.

Wet Mares

Nurture® supports postpartum recovery through accelerated reduction of inflammation of the womb promoting a rapid restoration of health and vitality. Nutrients are then passed through the mares milk to the foal whilst energy is utilised by the mare to maintain condition and health whilst nursing.

Foals

Foals will emulate their mum from 1-2 weeks and start to pick up and chew Nurture®. A double action is achieved where the foal is receiving nutrients through the milk from the nutrition but also directly as it takes up an increasing volume of feed itself naturally. DHA has a scientifically proven effect on early foal behaviour with studies showing less time for a foal to begin nursing and also doing so for longer periods of time.

Weanlings

With weanlings fully accustomed to Nurture® the transition off mares milk and the associated weaning check is significantly reduced. Support for further optimal development and growth achieved.

Yearlings

Optimal growth and development is achieved as increasing amounts of Nurture® can be fed in line with bodyweight increases.

Yearling Prep

Nurture® provides an ideal nutrient base to which other elements such as Keyflow Pink Mash® and Keyflow Key-Plus can be added to achieve healthy musculature and skeletal development for sale ring readiness.

2YOs

Nurture® supports continued development of the equine to ensure longevity and health in all pursuits

Horses that require musculature development

Feed as a base ration to horses that need extra muscle mass and development

Key features

Fully Steam Extruded - Predigested

Steam extrusion is a gentle, pre-digestive cooking process that allows for maximum absorption of feed nutrients. This unique process increases molecule surface area allowing for over 90% digestibility in the small intestine. Steam extrusion enables you to feed less volume which is best matched to the equine digestive system.

High Fibre

Nurture® is made using super fibre which offers superior digestibility to traditional fibre sources such as hay, grass or chaff. Super fibre is readily fermented in the hind gut producing a slow release source of cool energy and promoting hind gut and general digestive health.

DHA OMEGA 3

This formulation includes a unique source of algal DHA (docosahexaenoic acid). This long chain omega 3 fatty acid is scientifically proven to support stallion semen motility, fertility, mare postpartum health, early foal behaviour and young stock development.

Low Sugar & Starch

Feeding a low sugar and starch diet helps to maintain gastric, muscular and digestive health whilst reducing risk of starch related issues which may include uneven bone development as well as poor hindgut health and the associated behavioural/clinical issues.

EQ-Amino Pack

Nurture® contains multiple, high quality protein sources and nutrients that have been carefully selected to match the unique amino acid composition of equine tissue. This ensures optimal development rates and tissue quality through all growth stages.
